[Claim Your Guide Now](#) 

This is a basic KSOAP Android tutorial - here I will show you how to get started with KSOAP on Android. As you may know, we often want to access Web services via hand-held devices, and most likely you will run into trouble parsing the WSDL and the SOAP messages. Since I come from a .NET background, once I started developing on Android, I realized how much work has been Visual Studio doing for me.

That thought took me to search for a framework or library to help me consume

Web Services with Android. I ran into KSOAP2, which seemed like a good library, but unfortunately, very badly documented for most scenarios, like passing or returning complex objects, working with arrays of objects or even working with dates.

Shell

All of this I needed to find out by myself and this is why I decided to write this tutorial. So, let's begin.

## Getting Started with KSOAP on Android

First things first, so you should now go ahead and download the KSOAP library from Sourceforge Google code (**\*UPDATE\*** thanks Freddy):

<http://code.google.com/p/ksoap2-android/downloads/detail?name=ksoap2-android-assembly-2.4-jar-with-dependencies.jar&can=2&q=>

Then copy and paste the KSOAP library in the folder where your Android project will reside. Open Eclipse, start a new Android Project, right-click on the project's name and choose Properties, like this:

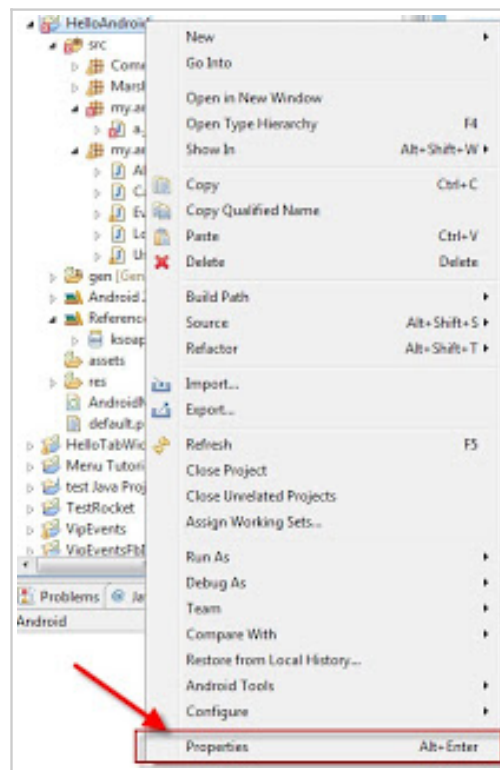

There was an error in this gadget

Go ahead and press Add JARs... button. Then navigate to the folder where your KSOAP library is and select it. Once you have this done, you are ready to start working with your Web Service library.

## Simple Web Service Calls with KSOAP

First, let's take a look at our web service call in Visual Studio:

```
[WebService(Namespace = "http://vladozver.org/")]
public class SimpleWebServices : System.Web.Services.WebService
{
    [WebMethod]
    public int GetSumOfTwoInts(int Operand1, int Operand2 )
    {
        return Operand1 + Operand2;
    }
}
```

The service is deployed on my local machine which is on the address: 192.168.1.3. Pay attention on the ending "/" in the Namespace.

Now, KSOAP finally.

KSOAP relies on a basic object called SoapObject. For this SoapObject, there are 3 variables

AdChoices 

**Apps on**  
**Google Play**

[play.google.com](http://play.google.com)

Browse and install  
Android apps from  
your phone, tablet  
or the web

that are important:

The Web Service Namespace

The Web Service Method Name

The Web Service URL

There is another extra variable which is important and is called SOAP\_ACTION, but that is basically a concatenation of the Namespace and Method name:

SOAP\_ACTION = NAMESPACE + METHOD\_NAME;

For now we will create 3 strings for the respective variables:

```
String NAMESPACE = "http://vladozver.org/";  
String METHOD_NAME = "GetSumOfTwoInts";  
String SOAP_ACTION = "http://vladozver.org/GetSumOfTwoInts";  
String URL = "http://192.168.1.3/VipEvents/Services/BasicServices  
.asmx";
```

Then we will create the SoapObject:

```
SoapObject Request = new SoapObject(NAMESPACE, METHOD_NAME);
```

Parameters in KSOAP are passed via PropertyInfo class instances, so we will create some of those:

```
PropertyInfo pi = new PropertyInfo();  
pi.setName("Operand1");
```

### Help

[Find Android Developers on oDesk](#)

```
pi.SetValue(2);
pi.setType(int.class);
Request.addProperty(pi);

PropertyInfo pi2 = new PropertyInfo();
pi2.setName("Operand2");
pi2.SetValue(5);
pi2.setType(int.class);
Request.addProperty(pi2);
```

Then we will create another important KSOAP object, and that is Soap Envelope:

```
SoapSerializationEnvelope envelope = new SoapSerializationEnvelope(SoapEn
velope.VER11);
envelope.dotNet = true;
envelope.setOutputSoapObject(Request);
```

Because our Web Service is .NET based, we need to set the .dotNet property to true.

Next step is to create a Transport object:

```
AndroidHttpTransport androidHttpTransport = new AndroidHttpTransport(URL)
;
```

Lastly, we need to invoke the web service and obtain the result:

[try](#)

[Download CsharpGears Framework](#)

```

        {
            androidHttpTransport.call(SOAP_ACTION, envelope);
            SoapObject response = (SoapObject)envelope.getResponse();
            int result = Integer.parseInt(response.getProperty(0).toString());
        }
        catch(Exception e)
        {
            e.printStackTrace();
        }
    }
}

```

That is basically it! I hope you will find this tutorial helpful, as I see that many people are looking for a simple Getting started tutorial on KSOAP Android. For more advanced usage of KSOAP, refer to my other posts on this topic.

mosabua said...

You should look at the ksoap2-android project and use it, since it is actively taking contributions and contains a bunch of fixes like HttpsTransport, more convenience methods on SoapObject and actually working attribute parsing. <http://code.google.com/p/ksoap2-android/>

November 25, 2010 4:58 PM

SeeSharpWriter said...

Thank you, mosabua, I already contribute to the ksoap2-android project on google code. Thanks for commenting, I appreciate it.

Avinash said...

Hi, i hav imported all the classes of org.Ksoap

but i am getting error in

```
AndroidHttpTransport androidHttpTransport = new AndroidHttpTransport(URL);
```

because i am not able to find AndroidHttpTransport class in Ksoap that i downloaded from <http://sourceforge.net/projects/ksoap2/>

December 4, 2010 6:23 AM

SeeSharpWriter said...

Avinash,

if you have this included:

```
org.ksoap2.transport.AndroidHttpTransport;
```

then the class should be available - make sure that you have it included.

Also you can check whether you have this line in your Android manifest file:

December 4, 2010 7:05 PM

SeeSharpWriter said...

```
<uses-permission android:name="android.permission.INTERNET" ></uses-permission>  
<uses-sdk android:minSdkVersion="7" />
```

Avinash said...

Hi,  
Thanks for ur reply, but if i include  
`org.ksoap2.transport.AndroidHttpTransport;`

This gives an error, because that library is missing from Ksoap that i downloaded from  
<http://sourceforge.net/projects/ksoap2/>

or is there any latest Ksoap library that i need to download.

Thanks in advance

December 6, 2010 6:29 AM

Avinash said...

Hi ,

thanks for your reply, but if i include  
`org.ksoap2.transport.AndroidHttpTransport;`

this gives an error because i am actually missing this library that i downloaded from

<http://sourceforge.net/projects/ksoap2/>

i even browsed in the project ,this class is missing .Is there any latest Ksoap download that i need to include?

Thanks in advance

December 6, 2010 6:34 AM

SeeSharpWriter said...

Avinash, please share me your email, I will send it my version of KSOAP to you which contains AndroidHttpTransport for sure - in meanwhile I will check with the code maintainers whether they have made a mistake or not.

frenklin said...

How can I call function with int[] input parameter?

```
PropertyInfo pi=new PropertyInfo();  
pi.setType(int[].class);  
pi.setName("aValues");  
pi.setValue(aValues);
```

didn't work

December 10, 2010 3:39 PM

SeeSharpWriter said...

Frenklin, this is probably the only case I don't know exactly how to implement. The situation gets even worse if you wanted to pass an array of complex objects as a parameter.

My best shot here would be to implement the Marshal interface like I did it in this post:

[Implementing KSOAP Marshal Interface](#)

This interface basically tells KSOAP how to serialize and deserialize objects.

frenklin said...

Thx, but I don't need serialize complex objects

solved

```
PropertyInfo pi=new PropertyInfo();
PropertyInfo piElementType=new PropertyInfo(); piElementType.setName("int");
pi.setElementType(piElementType);
```

```
Vector v=new Vector();
for(int i=0;i<Ids.length;i++){
v.add(Ids[i]);
}
pi.setName("Ids");
pi.setValue(v);
```

December 10, 2010 9:51 PM

SeeSharpWriter said...

I understand, excellent! But why do you need the variable piElementType ? By invoking setName() method you only tell the argument name?

Would it work without it?

Like saying:

```
pi.setElementType(pi);
Vector v = new Vector()
// etc... the rest of the code
```

December 11, 2010 11:34 AM

frenklin said...

.Net WSDL has array input parameters looks like

```
<lds>
<int>123</int>
<int>123</int>
</lds>
```

If you didn't set setElementType ksoap2 generate request

```
<lds>
<element>123</element>
<element>123</element>
</lds>
```

anil said...

hi, i am beginner to android application. I have created web service in visual studio which looks like:

```
Imports System.Web
Imports System.Web.Services
Imports System.Web.Services.Protocols
```

' To allow this Web Service to be called from script, using ASP.NET AJAX, uncomment the following line.

```
'
—
—
```

```
—  
—  
Public Class Service  
Inherits System.Web.Services.WebService
```

```
—  
Public Function HelloWorld() As String  
Return "Hello Fren how are you"  
End Function
```

```
End Class
```

and i have included following coding in my src-com.webservicetest-webservicetest.java as:

```
package com.webservicetest;  
import org.ksoap2.SoapEnvelope;  
import org.ksoap2.serialization.SoapObject;  
import org.ksoap2.serialization.SoapSerializationEnvelope;  
import org.ksoap2.transport.HttpTransportSE;  
import android.app.Activity;  
  
public class webservicetest extends Activity {  
private static final String NAMESPACE = "http://localhost/webservicetest/" ;  
private static final String URL = "http://192.168.1.10/webservicetest/Service.asmx";  
private static final String HelloWorld_SOAP_ACTION =  
"http://localhost/webservicetest/HelloWorld";  
private static final String METHOD_NAME1 = "HelloWorld";  
  
public static void main(String[] args)  
{
```

```

GetHelloWorld();
}
/** Called when the activity is first created. */
public static void GetHelloWorld() {

    SoapObject request = new SoapObject(NAMESPACE, METHOD_NAME1);
    //SoapSerializationEnvelope envelope =new SoapSerializationEnvelope(SoapEnvelope.VER11);
    //envelope.dotNet = true;
    //envelope.setOutputSoapObject(request);

    SoapSerializationEnvelope envelope = new SoapSerializationEnvelope(SoapEnvelope.VER11);
    envelope.dotNet = true;
    envelope.setOutputSoapObject(request);

    HttpTransportSE androidHttpTransport = new HttpTransportSE(URL);
    try
    {

        androidHttpTransport.call(HelloWorld_SOAP_ACTION, envelope);
        SoapObject response = (SoapObject)envelope.getResponse();
        int result = Integer.parseInt(response.getProperty(0).toString());

    }
    catch(Exception e)
    {

        e.printStackTrace();

    }
}

```

```
}  
}
```

and the problem is that i am not getting any result in android emulator. i am not aware of the error that might have occurred..did i miss any coding portion?

please help me out..

private static final String HelloWorld_SOAP_ACTION =
"http://localhost/webservicetest/HelloWorld";

private static final String METHOD_NAME1 = "HelloWorld";

public static void main(String[] args)

{
GetHelloWorld();

}

/** Called when the activity is first created. */

public static void GetHelloWorld() {

SoapObject request = new SoapObject(NAMESPACE, METHOD_NAME1);

//SoapSerializationEnvelope envelope =new SoapSerializationEnvelope(SoapEnvelope.VER11);
```

```
SoapSerializationEnvelope envelope = new SoapSerializationEnvelope(SoapEnvelope.VER11);

envelope.dotNet = true;

envelope.setOutputSoapObject(request);

HttpTransportSE androidHttpTransport = new HttpTransportSE(URL);

try
{

    androidHttpTransport.call(HelloWorld_SOAP_ACTION, envelope);

    SoapObject response = (SoapObject)envelope.getResponse();

    int result = Integer.parseInt(response.getProperty(0).toString());

}

catch(Exception e)

{

    e.printStackTrace();
```

```
}
```

```
}
```

```
}
```

i am getting error in "int result = Integer.parseInt(response.getProperty(0).toString());" as "The local variable result is never read". i am not being able to find out as i am new to it. May be my question is not that specific.i hope you will consider it.

Hope to hear soon from you all.

So where is the latest ksoap2 library, I'm also having an issue with the following imports:

```
import org.ksoap2.transport.AndroidHttpTransport;
```

```
import org.ksoap2.transport.HttpTransportSE;
```

January 18, 2011 10:40 PM

SeeSharpWriter said...

The latest KSOAP2 library can be downloaded from here:  
<http://sourceforge.net/projects/ksoap2/>

After that you need to add the JAR to the project, as denoted in the post.

January 19, 2011 1:02 PM

Anonymous said...

I've already downloaded this KSOAP2 library from <http://sourceforge.net/projects/ksoap2/> but it does not contain these classes:  
org.ksoap2.transport.AndroidHttpTransport;  
org.ksoap2.transport.HttpTransportSE;

January 19, 2011 4:46 PM

SeeSharpWriter said...

Perhaps you could tell me your email address and I will send you my JAR which contains those classes for sure.

I will also ask people who maintain the code to check whether these crucial classes are indeed missing. Thanks

January 20, 2011 9:02 AM

Freddy said...

Your code is working great, however I had a lot of trouble making it work because neither version in <http://sourceforge.net/projects/ksoap2/> works with it, for all of those interested you

should use this one:

ksoap2-android-assembly-2.4-jar-with-dependencies.jar

You can find it in: <http://code.google.com/p/ksoap2-android/downloads/detail?name=ksoap2-android-assembly-2.4-jar-with-dependencies.jar&can=2&q=>

It's actually KSOAP2-android not just KSOAP2.

Also you have a mistake in the try catch clause where you use the AndroidHttpTransport, which should be like this:

```
try
{
    AndroidHttpTransport transp = new AndroidHttpTransport(URL);
    transp.call(SOAP_ACTION, envelope);
    SoapPrimitive result = (SoapPrimitive)envelope.getResponse();
    btn.setText(result.toString());

}
catch(Exception e)
{ btn.setText(e.toString());
  e.printStackTrace();
}
```

For everyone who wants it, this is the full code that I've tested and it's working 100% fine using Eclipse Helios Release Build id: 20100617-1415

```
package com.android.KSOAP;
import org.ksoap2.*;
import org.ksoap2.serialization.KvmSerializable;
```

```
import org.ksoap2.serialization.Marshal;
import org.ksoap2.serialization.PropertyInfo;
import org.ksoap2.serialization.SoapObject;
import org.ksoap2.serialization.SoapPrimitive;
import org.ksoap2.serialization.SoapSerializationEnvelope;
import org.ksoap2.transport.AndroidHttpTransport;
import org.ksoap2.transport.HttpTransportSE;
import org.xmlpull.v1.XmlPullParserException;
import org.ksoap2.transport.AndroidHttpTransport;
import android.app.Activity;
import android.os.Bundle;
import android.view.View;
import android.widget.Button;

public class KSOAP extends Activity implements View.OnClickListener
{
    Button btn;
    /** Called when the activity is first created. */
    @Override
    public void onCreate(Bundle savedInstanceState)
    {
        super.onCreate(savedInstanceState);
        setContentView(R.layout.main);
        btn = new Button(this);
        btn.setOnClickListener(this);
        setContentView(btn);

    }
    @Override
    public void onClick(View view)
    {
        String NAMESPACE = "http://vladozver.org/";
```

```
String METHOD_NAME = "GetSumOfTwoInts";
String SOAP_ACTION = "http://madozver.org/GetSumOfTwoInts";
String URL = "http://192.168.1.4/SimpleWebService/SimpleWebService.asmx";
SoapObject Request = new SoapObject(NAMESPACE, METHOD_NAME);
PropertyInfo pi = new PropertyInfo();
pi.setName("Operand1");
pi.setValue(2);
pi.setType(int.class);
Request.addProperty(pi);

PropertyInfo pi2 = new PropertyInfo();
pi2.setName("Operand2");
pi2.setValue(5);
pi2.setType(int.class);
Request.addProperty(pi2);

SoapSerializationEnvelope envelope = new SoapSerializationEnvelope(SoapEnvelope.VER11);
envelope.dotNet = true;
envelope.setOutputSoapObject(Request);
try
{
    AndroidHttpTransport transp = new AndroidHttpTransport(URL);
    transp.call(SOAP_ACTION, envelope);
    SoapPrimitive result = (SoapPrimitive)envelope.getResponse();
    btn.setText(result.toString());

}
catch(Exception e)
{ btn.setText(e.toString());
  e.printStackTrace();
}
```

```
}  
}
```

It just show the result of the call to the webservice in the button caption.

Best Regards

Freddy Ayala

Thanks a lot... very helpful link... one more que, what if i want to send file?

[March 15, 2011 10:23 AM](#)

[SeeSharpWriter](#) said...

You would need to convert it to array of bytes and then send it to the server. I had a pretty rough time sending an image via web service. I will paste the code if I find it.

**thak** said...

I'm having a heck of a time getting any sort of response from the SOAP service format that I've attached. Is it because the parameters are nested "two deep"?

I've tried setting up an "AuthenticationInfo" class with "userName" and "password", but it fails with a "NullPointerException" error when doing the basic "httpTransportSE.call(SOAP\_ACTION, envelope)" statement.

It seems like based on everything I've read that I need a "Login" class that contains the "AuthenticationInfo" class, which seems ridiculous. Please tell me I'm crazy, and that there's an easy way to do this.

(I've replaced the <> with [].)

```
[soap:Envelope xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xmlns:xsd="http://www.w3.org/2001/XMLSchema"
xmlns:soapenc="http://schemas.xmlsoap.org/soap/encoding/" xmlns:tns="http://sample.com"
xmlns:types="http://sample.com/encodedTypes"
xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/"]
[soap:Body soap:encodingStyle="http://schemas.xmlsoap.org/soap/encoding/"]
[tns:Login]
[oAuthenticationInfo href="#id1" /]
[/tns:Login]
[tns:AuthenticationInfo id="id1" xsi:type="tns:AuthenticationInfo"]
[userName xsi:type="xsd:string"]string[/userName]
[password xsi:type="xsd:string"]string[/password]
[/tns:AuthenticationInfo]
[/soap:Body]
[/soap:Envelope]
```

March 31, 2011 5:27 AM

SeeSharpWriter said...

Thak, take it easy a little bit :)

As per my understanding, you need to implement a Login functionality via SOAP Webservice..  
Right ?

Please paste your whole code from Android's side for invoking the service, and the Webservice signature from .NET's side.

March 31, 2011 10:57 AM

Anonymous said...

Hi,

I couldn't use PropertyInfo methods, ie setName, setValue, setType. I got error for SoapObject.AddProperty as well. Please help.

I added the KSOAP library to the project and I imported all that you have given

```
//import org.ksoap2.*;  
import org.ksoap2.serialization.KvmSerializable;  
import org.ksoap2.serialization.Marshal;  
import org.ksoap2.serialization.PropertyInfo;  
import org.ksoap2.serialization.SoapObject;  
import org.ksoap2.serialization.SoapPrimitive;  
import org.ksoap2.serialization.SoapSerializationEnvelope;  
import org.ksoap2.transport.AndroidHttpTransport;  
import org.ksoap2.transport.HttpTransportSE;  
import org.xmlpull.v1.XmlPullParserException;//
```

March 31, 2011 11:50 AM

thak said...

Unfortunately, I can't make changes to the .NET service at all, I can only consume it. And I can't post all of my code online either due to NDA.

I was hoping that the service definition I posted from the asmx would be enough to identify how deeply I need the object to be nested.

Please let me know how I can contact you directly if it's not too much trouble.

Thanks. :)

March 31, 2011 1:21 PM

SeeSharpWriter said...

@Anonymous,

please try to download and use KSOAP from here: <http://code.google.com/p/ksoap2-android/downloads/detail?name=ksoap2-android-assembly-2.4-jar-with-dependencies.jar&can=2&q=>

@thak, since you cannot paste any code,

basically you need to have exact replica of the classes from both Android and .NET side, and read this post to see how to pass and retrieve complex objects between web services and Android:

<http://seesharpgears.blogspot.com/2010/10/ksoap-android-web-service-tutorial-with.html>

March 31, 2011 2:43 PM

Anonymous said...

@ SeeSharpWriter

Thanks. After I used the KSOAP you gave, it works.

But I couldnt connect to webservice. My program runs before the below line.

```
androidHttpTransport.call(SOAP_ACTION, envelope);  
SoapObject response = (SoapObject)envelope.getResponse();
```

I tried setting the text view.  
`textView4.setText("Inside TRY" );`

It was successful just before the "androidHttpTransport.call", but nothing happens after that.  
Please help.

April 1, 2011 11:32 AM

SeeSharpWriter said...

Please paste the whole code for invoking the web service and the .NET web service signature.

April 1, 2011 12:50 PM

thak said...

The WSDL for my "nested object" is:

```
[s:complexType name="AuthenticationInfo"]  
[s:sequence]  
[s:element minOccurs="0" maxOccurs="1" form="unqualified" name="userName"  
type="s:string" /]  
[s:element minOccurs="0" maxOccurs="1" form="unqualified" name="password"  
type="s:string" /]  
[/s:sequence]  
[/s:complexType]
```

Here's the code on the Android side (obviously, I've got a class for AuthenticationInfo with two

string variables):

```
AuthenticationInfo auth = new AuthenticationInfo("username", "password");
```

```
SoapObject Request = new SoapObject(NAMESPACE, METHOD_NAME);
```

```
PropertyInfo pi = new PropertyInfo();
```

```
pi.setName("AuthenticationInfo");
```

```
pi.setValue(auth);
```

```
pi.setType(auth.getClass());
```

```
Request.addProperty(pi);
```

```
SoapSerializationEnvelope envelope = new SoapSerializationEnvelope(SoapEnvelope.VER11);
```

```
envelope.dotNet = true;
```

```
envelope.bodyOut = Request;
```

```
envelope.encodingStyle = SoapSerializationEnvelope.ENC;
```

```
envelope.setOutputSoapObject(Request);
```

```
envelope.addMapping(NAMESPACE, "AuthenticationInfo", new AuthenticationInfo().getClass());
```

```
HttpTransportSE httpTransportSE = new HttpTransportSE(URL);
```

```
httpTransportSE.debug = true;
```

```
try
```

```
{
```

```
httpTransportSE.call(SOAP_ACTION, envelope);
```

```
Object response = envelope.getResponse();
```

```
SoapObject body = (SoapObject) envelope.bodyIn;
```

```
SoapPrimitive resultString = (SoapPrimitive) envelope.getResponse();
```

```
TextView tv = (TextView)findViewById(R.id.tvResult);
tv.setText(resultString);
}
catch(IOException e) {
System.out.println(e.toString());
e.printStackTrace();
}
catch(XmlPullParserException e) {
System.out.println(e.toString());
e.printStackTrace();
}
catch(Exception e)
{
e.printStackTrace();
}
```

April 2, 2011 3:28 AM

SeeSharpWriter said...

Your AuthenticationInfo on Android side class needs to implement the KVMSerializable interface.. please see this post of mine:

<http://seesharpgears.blogspot.com/2010/10/ksoap-android-web-service-tutorial-with.html>

There I describe how a class should implement the interface.

April 2, 2011 12:21 PM

thak said...

I did the KVMSerializable bit already, but I missed the "getPropertyInfo" function, so thanks for

mentioning that.

It looks like the problem is in the actual envelope formatting. Here's what it's expecting (captured from an existing .NET Windows app):

```
[?xml version="1.0" encoding="utf-16"?]
[soap:Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:soapenc="http://schemas.xmlsoap.org/soap/encoding/" xmlns:tns="http://sample.com"
xmlns:types="http://sample.com/encodedTypes"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xmlns:xsd="http://www.w3.org/2001/XMLSchema"]
[soap:Body soap:encodingStyle="http://schemas.xmlsoap.org/soap/encoding/"]
[tns:Login]
[oAuthenticationInfo href="#id1" /]
[/tns:Login]
[tns:AuthenticationInfo id="id1" xsi:type="tns:AuthenticationInfo"]
[userName xsi:type="xsd:string"]userid[/userName]
[password xsi:type="xsd:string"]password[/password]
[/tns:AuthenticationInfo]
[/soap:Body]
[/soap:Envelope]
```

And here's what I'm sending from ksoap2:

```
[v:Envelope xmlns:i="http://www.w3.org/2001/XMLSchema-instance"
xmlns:d="http://www.w3.org/2001/XMLSchema"
xmlns:c="http://schemas.xmlsoap.org/soap/encoding/"
xmlns:v="http://schemas.xmlsoap.org/soap/envelope/"][v:Header /][v:Body][Login
xmlns="http://sample.com/" id="o0" c:root="1"][AuthenticationInfo
i:type="n0:AuthenticationInfo" xmlns:n0="http://sample.com/"][userName
i:type="d:string"]userid[/userName][password
```

i:type="d:string"]password[/password][[/AuthenticationInfo][[/Login][[/v.Body][[/v.Envelope]

April 2, 2011 3:07 PM

thak said...

The more I'm looking at this, the more it looks like it may be the ksoap2 library switching around the 1.1 and 1.2 specifications. Or perhaps it's the service I'm trying to use that's doing that. My head hurts. :)

April 2, 2011 4:22 PM

Hi,

Can the simulator access the internet through the PC to connect to the webservice.

Because I can access the webservice( which is in same network as host PC) through the host PC browser, But if I run the emulator nothing happens.

Please help. Thanks a ton :)

April 4, 2011 11:07 AM

SeeSharpWriter said...

You need to have the following permission in the manifest file:

```
<manifest xmlns:android...>
```

```
...
```

```
<uses-permission android:name="android.permission.INTERNET"></uses-permission>
```

</manifest>

Munna said...

Hi, I'm a newbie to android and java.. I have two webservices, one will insert the values into database, and the other will return the values from the database.

My first webservice is working fine, I'm able to insert the values into databse..

And my second webservice is also working fine, but I'm returning the values as a dataset..

So I'm getting "java.lang.ClassCastException: org.ksoap2.serialization.SoapObject"

Can anyone help me how to solve getting or parsing the resultant dataset values..

Thanks in advance

April 11, 2011 11:05 AM

SeeSharpWriter said...

I suggest that you return an array of your objects instead of DataSet - also remember to write the same class on both Android and .NET side.

Hi everyone,I'm writing a soap client using ksoap.My problem is that I receive an empty response,this is my code:

```
import org.ksoap2.SoapEnvelope;
import org.ksoap2.serialization.PropertyInfo;
import org.ksoap2.serialization.SoapObject;
import org.ksoap2.serialization.SoapPrimitive;
import org.ksoap2.serialization.SoapSerializationEnvelope;
import org.ksoap2.transport.AndroidHttpTransport;
import org.ksoap2.transport.HttpTransportSE;
import android.app.Activity;
import android.os.Bundle;
import android.util.Log;
import android.widget.TextView;
```

```

public class SOAP2 extends Activity {

    private static String SOAP_ACTION = "http://session/getAllPositions";
    private static String METHOD_NAME = "getAllPositions";
    private static String NAMESPACE = "http://session/";
    private static String URL ="http://192.41.218.56:8080/WSGeoEAR-
    WSGeoServer/NavFinderBean?WSDL";

    TextView tv;
    /** Called when the activity is first created. */
    @Override
    public void onCreate(Bundle icle) {
        super.onCreate(icle);
        setContentView(R.layout.main);
        // tv=(TextView)findViewById(R.id.result);
        try {

            Log.i("Invio request", "1");
            //Chiamo il Metodo del WebServer
            SoapObject request = new SoapObject(NAMESPACE, METHOD_NAME);

            Log.i("PROPERTYINFO", "2");
            /* PropertyInfo propertyInfo=new PropertyInfo();
            propertyInfo.setName("arg0");
            propertyInfo.setValue(1);
            //propertyInfo.setNamespace(NAMESPACE);

            request.addProperty(propertyInfo);*/
            request.addProperty("arg0", 1);

```

```

Log.i("Aggiunte le proprietà alla request", "3");

SoapSerializationEnvelope envelope = new SoapSerializationEnvelope(SoapEnvelope.VER11);

envelope.dotNet = true;
envelope.setOutputSoapObject(request);
Log.i("ENVELOPE SETTATA", "4");
envelope.setAddAdornments(false);
//envelope.headerOut = null;

HttpTransportSE androidHttpTransport = new HttpTransportSE(URL);
Log.i("Trasport url", "5");
androidHttpTransport.debug = true;
androidHttpTransport.call(SOAP_ACTION, envelope);
Log.i("Envelope inviata", "6");
//Prende la risposta SOAP e ne estrae il corpo

SoapObject resultsRequestSOAP = (SoapObject) envelope.bodyIn;

Log.i("Ricevuta risposta", "7");
Log.i("PropertyCount", "" + resultsRequestSOAP.getPropertyCount());
Log.i("Contiamo gli attributi", "" + resultsRequestSOAP.getAttributeCount());

String res = resultsRequestSOAP.toString();
Log.i("Metto la risposta nella var res", "8");

((TextView)findViewById(R.id.lblStatus)).setText(res);

Log.i("STAMPO A VIDEO", "9");
}catch(Exception E) {
((TextView)findViewById(R.id.lblStatus)).setText("ERROR:" + E.getClass().getName() + ": " +

```

```
E.getMessage());  
Log.i("Stampo errore", "9");  
}  
}  
}
```

Can you help me?

May 4, 2011 6:38 PM

SeeSharpWriter said...

Could you paste the signature of the Web Service you are trying to reach? The URL does not seem like a .NET web service to me

May 5, 2011 1:34 PM

Anonymous said...

I've only the WSDL, it isn't a .net web service, but a SOAP web service.

May 6, 2011 4:09 PM

Dan Steg said...

Anyway to see the actual xml produced and recieved?

I'm trying to connect to a webservice to I don't control, so I know very little about it, just the calls. Normally I'd just make some kinda wsdl binding, however, that's not possible in android :S

Seeing the actual xml would really help a lot with the debugging

thanks

May 6, 2011 10:14 PM

Anonymous said...

I've your same problem Dan Steg, I've tried to configure tcp/ip monitor on eclipse, but it doesn't work for me..

May 7, 2011 6:56 PM

SeeSharpWriter said...

If it is not a .NET web service, this code will not work for you.

May 8, 2011 1:55 AM

SeeSharpWriter said...

Dan, I think there is a debug mode in KSOAP2, but I have never used it, so you might consider searching through the documentation.

Anyways, even though you do not control the web service, you can judge what input/output parameters are.

May 8, 2011 1:56 AM

Dan Steg said...

Thanks SeeSharpWriter

I'll look into that. what the other guy said about tcp/ip also gave me an idea. Running the app is

on the emulator, so checking eclipse's tcp/ip wont help none, however, mayber you can look a bit closer on the androidHttpTransport, that's the instance making all the calls.

May 8, 2011 10:17 AM

Dan Steg said...

```
AndroidHttpTransport androidHttpTransport = new AndroidHttpTransport(URL);
androidHttpTransport.debug = true;
```

then make the call: androidHttpTransport.call...etc

after the call:

```
Log.d("rq.dump", androidHttpTransport.requestDump);
Log.d("rq.dump", androidHttpTransport.responseDump);
```

Then you can mark the line in the eclipse log and press ctrl+c and paste it in a notepad etc.

and there, you have the request + responce.

May 9, 2011 12:33 PM

Conrad Yoder said...

SeeSharpGears, thanks much for your tutorial here - it is helping me get started on a current project. I have a few questions here:

- I am using ksoap2-android-assembly version 2.5.4 and it appears that AndroidHttpTransport has been deprecated in favor of HttpTransportSE. Are there any known issues in using the latter in favor of the former?

- My SOAP endpoint is not from .NET, but from SQL Server (2005) Native XML Web Services. Is there anything else, besides changing envelope.dotNet = true to false, that needs to be changed? (I still have to deal with authentication, I know - I am working on that as well)

- Any knows issues with using https on the SOAP endpoint instead of http?

Thanks again for all your responses here!

May 17, 2011 8:51 PM

SeeSharpWriter said...

Hi Conrad,

I haven't noticed any issues by using HttpTransportSE (yet) :D

Yes, setting the envelope.dotNet is the only setting you need to take care of for using .NET services.

Whoa, I have never used it against SQL Server native web services. If you have time, please

share with us how are you doing that.

Oh and about the HTTPS, I am afraid many people have experienced problems using it :S , but who knows, maybe you will be lucky.

Hope I helped.

May 17, 2011 10:37 PM

Conrad Yoder said...

SSW, Thanks for the response.

I don't know if this will help in you interpreting what I need to do here, but below is an example of the WS-Security header for a SQL SOAP connection from <http://msdn.microsoft.com/en-us/library/ms180919%28v=SQL.90%29.aspx>:

```
=====
[SOAP-ENV:Header]
[wsse:Security xmlns:wsse=
"http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-wssecurity-secext-1.0.xsd"]
[wsse:UsernameToken]
[wsse:Username]JohnDoe[/wsse:Username]
[wsse:Password Type=
"http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-username-token-profile-
1.0#PasswordText"]pass-word1[/wsse:Password]
[/wsse:UsernameToken]
[/wsse:Security]
[/SOAP-ENV:Header]
=====
```

and here is how the invocation query should be formed from <http://msdn.microsoft.com/en-us/library/ms345123%28v=sql.90%29.aspx#>:

```
=====
[SOAP-ENV:Envelope
xmlns:SOAP-ENV="http://schemas.xmlsoap.org/soap/envelope/"]
[SOAP-ENV:Body]
[hello_world xmlns="http://tempuri.org/"]
[msg]Hello World![/msg]
[/hello_world]
[/SOAP-ENV:Body]
[/SOAP-ENV:Envelope]
=====
```

I'm beginning to wonder, given the complexity of KSOAP2, and the limited number of bytes I am going to be dealing with, might it just be easier to use some sort of raw HTTP interface? Or am I asking for even more trouble by doing it that way?

May 17, 2011 11:26 PM

Conrad Yoder said...

SSW, Thanks for the response.

I don't know if this will help in you interpreting what I need to do here, but below is an example of the WS-Security header for a SQL SOAP connection from <http://msdn.microsoft.com/en-us/library/ms180919%28v=SQL.90%29.aspx>:

```
=====
[SOAP-ENV:Header]
[wsse:Security xmlns:wsse=
"http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-wssecurity-secext-1.0.xsd"]
[wsse:UsernameToken]
```

```
[wsse:Username]JohnDoe[/wsse:Username]
[wsse:Password Type=
"http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-username-token-profile-
1.0#PasswordText"]pass-word1[/wsse:Password]
[/wsse:UsernameToken]
[/wsse:Security]
[/SOAP-ENV:Header]
```

=====

and here is how the invocation query should be formed from <http://msdn.microsoft.com/en-us/library/ms345123%28v=sql.90%29.aspx#>:

=====

```
[SOAP-ENV:Envelope
xmlns:SOAP-ENV="http://schemas.xmlsoap.org/soap/envelope/"]
[SOAP-ENV:Body]
[hello_world xmlns="http://tempuri.org/"]
[msg]Hello World![/msg]
[/hello_world]
[/SOAP-ENV:Body]
[/SOAP-ENV:Envelope]
```

=====

I'm beginning to wonder, given the complexity of KSOAP2, and the limited number of bytes I am going to be dealing with, might it just be easier to use some sort of raw HTTP interface? Or am I asking for even more trouble by doing it that way?

May 18, 2011 2:52 PM

Conrad Yoder said...

SSW, thanks for the comments. When I make the call to `HttpTransportSE.call()`, I am getting a

RuntimeException in the debugger. Does this sound like a familiar problem, or do I need to post my code to see what's happening?

May 18, 2011 3:33 PM

 Conrad Yoder said...

I don't know if this will help in you interpreting what I need to do here, but at this webpage is an example of the WS-Security header for a SQL SOAP connection from <http://msdn.microsoft.com/en-us/library/ms180919%28v=SQL.90%29.aspx> (I tried to post the specific code, but my post does not appear on the page then.)

And here is how the invocation query should be formed: <http://msdn.microsoft.com/en-us/library/ms345123%28v=sql.90%29.aspx#>

I'm beginning to wonder, given the complexity of KSOAP2, and the limited number of bytes I am going to be dealing with, might it just be easier to use some sort of raw HTTP interface? Or am I asking for even more trouble by doing it that way?

 SeeSharpWriter said...

There is probably an error in your application. You should check whether your Android app has access to the Internet in the config file, and make sure the NAMESPACE, SOAP\_ACTION and URL are correct.

My opinion is that using native web services from SQL Server will cause you a lot of headache.

May 19, 2011 9:05 AM

 Conrad Yoder said...

I do have

```
[uses-permission android:name="android.permission.INTERNET" /]
```

in my AndroidManifest.xml file (I am able to connect to a web server in another part of my code).

Here are the relevant variables:

```
String NAMESPACE = "http://tempuri.org/";
```

```
String SOAP_ACTION = "http://tempuri.org/GetPageNumber";
```

```
String URL = "http://10.199.5.30:88/ou812";
```

Hello Everyone, I have developed my app that uses a web Service i also developed. Using the Emulator i can connect to the web service and get response from it, but when i installed the app into an android phone i can not get any response. What is the problem?

[May 20, 2011 4:50 PM](#)

SeeSharpWriter said...

Do you have the permission for internet usage in your Android config file?

```
[uses-permission android:name="android.permission.INTERNET" ][/uses-permission]
```

Replace [ with < and ] with >.

Hi,  
How to return a data table of a web service to list view in android.

September 27, 2011 8:08 AM

SeeSharpWriter said...

Prasildas, do not return a data table from the web service. Instead, create a custom class and then return an array of your custom objects back to Android.

My web service never receives the parameters... I cant understand why !!

October 19, 2011 12:33 AM

NMO said...

Hi! I'm trying to pass an enum class to my WS.  
When it receives the call, the enum parameter is null.  
Here's the code

This class is the WS main parameter thats owns the enum

```
public class MyObject implements KvmSerializable{
...
private MyEnum myEnum;
...

@Override
public void getPropertyInfo(int arg0, Hashtable arg1, PropertyInfo arg2) {
switch (arg0){
case 0:
arg2.type = MyEnum.class;
arg2.name = "myEnum";
break;
case 1:
...
}
```

```
}
```

This is the enum Class

```
public enum MyEnum implements KvmSerializable {
```

```
    VALUE1,
```

```
    VALUE2,
```

```
    VALUE3,
```

```
    VALUE4;
```

```
    public String value() {
```

```
        return name();
```

```
    }
```

```
    public static MyEnum fromValue(String v) {
```

```
        return valueOf(v);
```

```
    }
```

```
    @Override
```

```
    public Object getProperty(int arg0) {
```

```
        // TODO Auto-generated method stub
```

```
        return value();
```

```
    }
```

```
    @Override
```

```
    public int getPropertyCount() {
```

```
        // TODO Auto-generated method stub
```

```
        return 1;
```

```
    }
```

```
    @Override
```

```
public void getPropertyInfo(int arg0, Hashtable arg1, PropertyInfo arg2) {  
    arg2.type = PropertyInfo.STRING_CLASS;  
    arg2.name = "value";  
}
```

@Override

```
public void setProperty(int arg0, Object arg1) {  
  
}  
}
```

I'm not very comfortable with this code because I don't really like the getPropertyInfo on the enum.

Any help? Is there anyway to pass an enum as a parameter or I shouldn't be using enums here at all?

Hi I am calling .net web service from Android Application .I am getting 'V' instead of 'soap' in the web request.

This is my code:

```
Map parameterMap=new HashMap();  
parameterMap.put("EmailAddress", "venkata.vanaparthi@dharaani.co.in");
```

```

parameterMap.put("Password", "12345678");
parameterMap.put("TokenID", "071D394A29E37AE4B14401B0EA9EB39F793A81E8");

.....
AndroidHttpTransport aht = null;
SoapSerializationEnvelope sse = null;
aht = new AndroidHttpTransport("http://parking.dharani.org/Services.asmx");
sse = new SoapSerializationEnvelope(SoapEnvelope.VER11);
sse.encodingStyle = SoapSerializationEnvelope.ENC2003;
sse.dotNet = true;
sse.setAddAdornments(false);
sse.setOutputSoapObject(requestSoapBody("AddCar", parameterMap));
aht.setXmlVersionTag("");
aht.debug=true;
aht.call("http://parkinghero.com/" + "AddCar", sse);
SoapObject resultsRequestSOAP = (SoapObject) sse.bodyIn;

private SoapObject requestSoapBody(String methodName,
Map propMap) {
SoapObject request = new SoapObject("http://parkinghero.com/",
methodName);
if (propMap != null) {
int mapsize = propMap.size();
Iterator keyValuePair1 = propMap.entrySet().iterator();
for (int i = 0; i < mapsize; i++) {
Map.Entry entry = (Map.Entry) keyValuePair1.next();

final String key = (String) entry.getKey();
final String value = (String) entry.getValue();
request.addProperty(key, value);
}

}
}

```

```
return request;  
}
```

thanks for the information you have provided here for us. When i send the information off i get a response of -1 anytype. Invalid api id and key. (ive double and triple checked so i know they are correct. I have to send an api key and an ID to get a response. This is what i have so far.  
package com.example;

```
public class Test implements KvmSerializable
{ public String ApiID;
  public String ApiKey;
  public Test(){}
  public Test(String apiID, String apiKey) {
    ApiID = apiID;
    ApiKey = apiKey;
  }
  public Object getProperty(int arg0) {

    switch(arg0)
    {

    case 0:
      return ApiID;
    case 1:
      return ApiKey;
    }

    return null;
  }

  public int getPropertyCount() {
    return 2;
```

```
}

public void getPropertyInfo(int index, Hashtable arg1, PropertyInfo info) {
    switch(index)
    {
        case 0:
            info.type = PropertyInfo.STRING_CLASS;
            info.name = "ApiID";
            break;
        case 1:
            info.type = PropertyInfo.STRING_CLASS;
            info.name = "ApiKey";
            break;
        default:break;
    }
}

public void setProperty(int index, Object value) {
    switch(index)
    {
        case 0:
            ApiID = value.toString();
            break;
        case 1:
            ApiKey = value.toString();
            break;
        default:
            break;
    }
}
}
```

Brandon Edley said...

This is the class doing the consuming

```
package com.example
```

```
public class AndroidClientService extends Activity {
```

```
    private static final String SOAP_ACTION = "https://book.mylimobiz.com/api/Test";
```

```
    private static final String API_ID = "r0rnyW1KLbxZE0Z";
```

```
    private static final String API_KEY = "Q0TUfJ$G6r9GP5OMwHCU";
```

```
    private static final String OPERATION_NAME = "Test";
```

```
    private static final String WSDL_TARGET_NAMESPACE = "https://book.mylimobiz.com/api";
```

```
    private static final String SOAP_ADDRESS =  
    "https://book.mylimobiz.com/api/ApiService.asmx";
```

```
@Override
```

```
public void onCreate(Bundle savedInstanceState) {
```

```
super.onCreate(savedInstanceState);
```

```
TextView textView = new TextView(this);
```

```
setContentView(textView);
```

```
Test T = new Test(API_ID, API_KEY);
```

```
SoapObject request = new SoapObject(WSDL_TARGET_NAMESPACE,
```

```
OPERATION_NAME);
```

```
PropertyInfo pi = new PropertyInfo();
```

```
pi.setName("Test");
```

```
pi.setNamespace(WSDL_TARGET_NAMESPACE);
```

```
pi.setValue(T);
```

```
pi.setType(T.getClass());
```

```
request.addProperty(pi);
```

```
SoapSerializationEnvelope envelope = new SoapSerializationEnvelope(
```

```
SoapEnvelope.VER11);
```

```
envelope.implicitTypes = true;
```

```
envelope.dotNet = true;
```

```
envelope.setOutputSoapObject(request);
```

```
envelope.addMapping(WSDL_TARGET_NAMESPACE, "Test", new Test().getClass());
```

```
HttpTransportSE httpTransport = new HttpTransportSE(SOAP_ADDRESS);
httpTransport.debug = true;
httpTransport.setXmlVersionTag("");

try

{

httpTransport.call(SOAP_ACTION, envelope);

SoapObject response = (SoapObject) envelope.getResponse();

T.ApiID = response.getProperty(0).toString();
T.ApiKey = response.getProperty(1).toString();

textView.setText(response.toString());

/*Object response = envelope.getResponse();

textView.setText(response.toString()); */

} catch (Exception exception)

{

textView.setText(exception.toString());

}
```

```
}  
}
```

Hi,  
SeeSharpWriter can you send me the ksoap jar file that contains  
org.ksoap2.transport.androidhttptransport  
on Darkairouanside@gmail.com ?

February 9, 2012 9:07 PM

SeeSharpWriter said...

Have you tried downloading KSOAP 2 from here?

<http://code.google.com/p/ksoap2-android/downloads/detail?name=ksoap2-android-assembly-2.4-jar-with-dependencies.jar&can=2&q=>

February 10, 2012 3:26 PM

Anonymous said...

Thanks your code works good.  
If I have to send array of byte to web service  
[http://192.168.7.158/uploader/FileUploader.aspx/UploadFile?  
f=BYTEaRRY&FileName=mypic.PNG](http://192.168.7.158/uploader/FileUploader.aspx/UploadFile?f=BYTEaRRY&FileName=mypic.PNG)

POST /uploader/FileUploader.aspx HTTP/1.1  
Host: 192.168.7.158

Content-Type: text/xml; charset=utf-8  
Content-Length: length  
SOAPAction: "http://tempuri.org/UploadFile"

base64Binary  
string

February 14, 2012 10:37 PM

SeeSharpWriter said...

Basically I have done this with encoding the byte array and then sending it to the server. When it arrives to the server you should decode it and assemble the picture.

If I find the code I will post it here.

Hi, I am new to android and using first the ksoap in my application. i work with the code that you had mentioned above. what i face the problem is that, when i

```
androidHttpTransport.call(SOAP_ACTION, envelope);
```

hit over this statement, it return's nothing or say blank, even the log's below this line has been printed on screen. Hope you understand my problem.

please help me out. thank you in advance. i am waiting for your response.

Nice Tutorial !!

Does KSoap support Soap with WSHTTP binding ?

How can we make soap envelope with class inside a class (Complex soap envelope body )

September 19, 2012 1:17 PM

[SeeSharpWriter](#) said...

@sunil Kuntal,

I don't know about WSHTTP binding.

The case with a class within a class I believe was covered by someone else in the comments.

thank you for your effort

I followed your steps but I have a problem :(

my android app give me an error when I run it like the application is stoped working here is my webserver code

```
using System;  
using System.Collections.Generic;  
using System.Linq;  
using System.Web;  
using System.Web.Services;
```

```
[WebService(Namespace = "http://madozver.org/")]
```

```
[WebServiceBinding(ConformsTo = WsiProfiles.BasicProfile1_1)]
```

// To allow this Web Service to be called from script, using ASP.NET AJAX, uncomment the following line.

```
[System.Web.Script.Services.ScriptService]
```

```
public class Service : System.Web.Services.WebService  
{  
    public Service () {
```

```
        //Uncomment the following line if using designed components  
        //InitializeComponent();  
    }
```

```
    [WebMethod]  
    public int GetSumOfTwoInts(int Operand1, int Operand2)  
    {  
        return Operand1 + Operand2;  
    }  
  
}
```

and here is my android app code

```
package com.ahmed.webservice;
```

```
import org.ksoap2.SoapEnvelope;  
import org.ksoap2.serialization.PropertyInfo;  
import org.ksoap2.serialization.SoapObject;  
import org.ksoap2.serialization.SoapSerializationEnvelope;
```

```
import android.os.Bundle;
import android.app.Activity;
import android.view.Menu;

import org.ksoap2.*;
import org.ksoap2.serialization.KvmSerializable;
import org.ksoap2.serialization.Marshal;
import org.ksoap2.serialization.PropertyInfo;
import org.ksoap2.serialization.SoapObject;
import org.ksoap2.serialization.SoapPrimitive;
import org.ksoap2.serialization.SoapSerializationEnvelope;
import org.ksoap2.transport.AndroidHttpTransport;
import org.ksoap2.transport.HttpTransportSE;
import org.xmlpull.v1.XmlPullParserException;

public class MainActivity extends Activity {

    @Override
    public void onCreate(Bundle savedInstanceState) {
        super.onCreate(savedInstanceState);
        setContentView(R.layout.activity_main);
        String NAMESPACE = "http://madozver.org/";
        String METHOD_NAME = "GetSumOfTwoInts";
        String SOAP_ACTION = "http://madozver.org/GetSumOfTwoInts";
        String URL = "http://192.168.1.1:49766/WebSite1/Service.asmx";

        SoapObject Request = new SoapObject(NAMESPACE, METHOD_NAME);

        PropertyInfo pi = new PropertyInfo();
```

```
pi.setName("Operand1");
pi.setValue(2);
pi.setType(int.class);
Request.addProperty(pi);

PropertyInfo pi2 = new PropertyInfo();
pi2.setName("Operand2");
pi2.setValue(5);
pi2.setType(int.class);
Request.addProperty(pi2);

SoapSerializationEnvelope envelope = new SoapSerializationEnvelope(SoapEnvelope.VER11);
envelope.dotNet = true;
envelope.setOutputSoapObject(Request);

AndroidHttpTransport androidHttpTransport = new AndroidHttpTransport(URL);

try
{
    androidHttpTransport.call(SOAP_ACTION, envelope);
    SoapObject response = (SoapObject)envelope.getResponse();
    int result = Integer.parseInt(response.getProperty(0).toString());
}
catch(Exception e)
{
    e.printStackTrace();
}
```

```
}
```

```
@Override
```

```
public boolean onCreateOptionsMenu(Menu menu) {  
    getMenuInflater().inflate(R.menu.activity_main, menu);  
    return true;  
}
```

```
}
```

```
}
```

please I need help :(
