

# Sai Geetha's Blog - Android

While this blog started off as my personal ramblings on Technical things it has turned out to be a blog dedicated to Android. Any other technical ramblings are shared at my [Technical Blog](#).

**NOTE:** Of late, I have been getting requests for very trivial problems that many of you are facing in your day-to-day work. This blog is not to solve your "project" problems - surely not a "Support" site.

I just love to share my knowledge in my spare time and would appreciate any questions or feedback on the articles and code I have shared. I also do appreciate thought-provoking questions that would lead me to write more articles and share.

But please do not put your day-to-day trivial problems here. Even if you do, you most probably would not get a response here.

Thanks

## SQLite DB Example | Android Developer Tutorial (Part 12)

There are 4 ways of storing data on the android platform:

- 1. Preferences
- 2. SQLite Database
- 3. Files
- 4. Network

### NOTE TO VISITORS

"Knowledge Grows When Shared!" is my belief and hence this blog. It would be wonderful if the visitors to this blog too can contribute by answering to questions posed. Not all questions here have an answer from me.

We can together create a veritable pool of knowledge here. Thanks

TOTAL PAGEVIEWS

A word about each of them here and then I will move on to an example that shows how to work with SQLite DB that comes along with the android platform.

### Preferences -

Basically used for storing user preferences for a single application or across applications for a mobile. This is typically name-value pairs accessible to the context.

### Databases –

Android supports creating of databases based on SQLite db. Each database is private to the applications that creates it

### Files -

Files can be directly stored on the mobile or on to an extended storage medium. By default other applications cannot access it.

### Network -

Data can be stored and retrieved from the network too depending on the availability.

If an application wants to store and retrieve data for its own use, without having to share the data across applications, it can access the SQLite DB directly. There is no need of a content provider. We have seen in an [earlier post how to use content providers](#).

In this example, we will do the following:

1. Create a database (typically a one time activity)
2. Create a table (typically a one time activity)
3. Insert values into the table
4. Retrieve the values from the table
5. Display the retrieved values as a List view

### ABOUT ME

 **Sai Geetha**

Bangalore,  
Karnataka, India

I am a solution  
designer as well as

6. Delete all the records from the table before closing the connection to the database

Step 1: Create a database:

```
sampleDB = this.openOrCreateDatabase(SAMPLE_DB_NAME, MODE_PRIVATE, null);
```

This opens a database defined in the constant `SAMPLE_DB_NAME`, if it already exists. Else it creates a database and opens it. The second parameter is operating mode : `MODE_PRIVATE` meaning it is accessible to only this context. The other modes are `MODE_WORLD_WRITABLE`. `MODE_WORLD_READABLE`

Step 2: Create a Table:

```
sampleDB.execSQL("CREATE TABLE IF NOT EXISTS " +  
    SAMPLE_TABLE_NAME +  
    " (LastName VARCHAR, FirstName VARCHAR, " +  
    " Country VARCHAR, Age INT(3));");
```

Step 3: Insert values into the table:

```
sampleDB.execSQL("INSERT INTO " +  
    SAMPLE_TABLE_NAME +  
    " Values ('Makam','Sai Geetha','India',25);");
```

Step 4: Retrieve values

```
Cursor c = sampleDB.rawQuery("SELECT FirstName, Age FROM " +
```

designer as well as

a technology explorer. On and off, I dabble with emerging technologies while sometimes I abstract out and work with things like architectural styles and patterns. [My LinkedIn Profile](#)

Members (905) [More »](#)

Already a member? [Sign in](#)

```

        SAMPLE_TABLE_NAME +
        " where Age > 10 LIMIT 5", null);

    if (c != null) {
        if (c.moveToFirst()) {
            do {
                String firstName = c.getString(c.getColumnIndex("FirstName"));
                int age = c.getInt(c.getColumnIndex("Age"));
                results.add("" + firstName + ",Age: " + age);
            } while (c.moveToNext());
        }
    }
}

```

Step 5: Display the values as a list

```

        this.setAdapter(new ArrayAdapter<String>(this,
        android.R.layout.simple_list_item_1, results));

```

The statement displays it as a list as the class extends a `ListActivity`.

Step 6: Delete the values from the table in the finally part of the try block

```

    finally {
        if (sampleDB != null)
            sampleDB.execSQL("DELETE FROM " + SAMPLE_TABLE_NAME);
        sampleDB.close();
    }

```

It is as simple as this to work with the SQLite DB even in android. No different from a desktop application. However, there are various overloaded methods of `query()` provided by the `SQLiteDatabase` class which can be more optimally used instead of `execSQL`.

Hi,

Really your tutorial helps me lot..  
But DELETE query not working for me. No error. Please post tutorial for updating the row.

[Reply](#)

**A Programmer** March 25, 2010 2:52 PM

Any luck on Delete Query?

[Reply](#)

**Sai Geetha**  March 25, 2010 4:54 PM

Can you please give more details about what are you trying to do in your delete query? Is it just the tutorial sample code?  
Which version of SDK are you using?

when i run this sqllitedbsample it is giving errors.

[Reply](#)

**Nezir** June 14, 2010 1:41 AM

Hi Sai I am an android & java beginner I just start to learn android programming and found your blog . You write this database sample very clear and when I start your downloaded project it work very well but now I create new project and try to copy your code and I had a problem with this line of code

```
" this.setAdapter(new ArrayAdapter(this, android.R.layout.simple_list_item_1,results));"
```

Error : "The method setListAdapter(ArrayAdapter) is undefined for the type create"

It's look like method in C# but I can found it in your project .

Where do I mistake ???

[Reply](#)

▼ [Replies](#)

**Dante** April 13, 2012 4:21 AM

I had a similiar error on a different project  
I solved the error by passing YourActivity.this in the argument of ArrayAdapter

**RUCHIT SHAH** September 5, 2012 6:29 PM

DOES YOUR ACTIVITY EXTENDS THE LIST ACTIVITY????

**Anonymous** June 22, 2010 12:59 PM

Hi Geetha,

Thanks a lot for such a well written blog and it has helped me a lot to get start with android. I was following this DB sample project of yours and wondering... what modifications should I make into your program to insert values into the DB which I capture through edittext widgets? Or in other words how can I capture values from a form and add them to my database? Looking forward for a reply.

Thanks

[Reply](#)

**Anonymous** June 30, 2010 6:03 PM

never mind... got it working. wrote a method like this

```
public void handleDataBase(String username, String email, String mobNum,
String password, String country, String remember) {
remember = "false";
SQLiteDatabase sampleDB = null;
try {
sampleDB = this.openOrCreateDatabase(SAMPLE_DB_NAME, MODE_WORLD_READABLE,
null);
```

```
sampleDB.execSQL("INSERT INTO " + SAMPLE_TABLE_NAME + " Values ("
+ username + "," + email + "," + mobNum + ","
+ password + "," + country + "," + remember + ");");
```

```
Cursor c = sampleDB.rawQuery("SELECT * FROM " +
```

```

SAMPLE_TABLE_NAME , null);
if (c != null ) {
if (c.moveToFirst()) {
do {
String name = c.getString(c.getColumnIndex("UserName"));
System.out.println("Name ----- "+ name);
}while (c.moveToNext());
}
}

} catch (SQLException se) {
Log.e(getClass().getSimpleName(),
"Could not create or Open the database");
}
finally {
if (sampleDB != null)
sampleDB.close();
}
}

```

[Reply](#)

**John** July 20, 2010 3:41 PM

2 things, First... In your delete Query you don't specify WHAT to delete... I think it should read

```

finally {
if (sampleDB != null)
sampleDB.execSQL("DELETE * FROM " + SAMPLE_TABLE_NAME);
sampleDB.close();
}

```

you forgot to put a "\*" to signify "all" from the database table between delete and from...

Secondly... the line

```
this.setAdapter(new ArrayAdapter(this, android.R.layout.simple_list_item_1,results))
```

should actually read

```
this.setListAdapter = new ArrayAdapter(this, android.R.layout.simple_list_item_1,results);
```

[Reply](#)

**Sai Geetha**  August 2, 2010 3:50 PM

Hi John,

DELETE FROM TABLE and DELETE \* FROM TABLE are both acceptable ways of doing the same thing.

The same with your second comment too. I hope you realize that my program s executing the way it is intended to. So, at least for that reason, they are not wrong syntactically

**bhynte** December 24, 2010 9:51 AM

thanks for your tutorial miss...

[Reply](#)

**Sai Geetha**  January 12, 2011 3:48 PM

Hi Anon - who asked about edit text - you would need to extract the text from an EditText Dialog using its getText() method - store it in a local variable - and construct a dynamic SQL query using those variable for insertion into the DB

[Reply](#)

**Sai Geetha**  January 12, 2011 3:54 PM

Hi HArish,

The database is created in the specific application folder. In my example, it is in /data/data/com.collabera.labs.sai.db/databases/myFriendsDb  
To view this in Eclipse, you must view through the DDMS perspective

[Reply](#)

[Reply](#)

**Anonymous** January 31, 2011 3:59 PM

hi sai geetha, ur tutorials are very helpfull bt im nt able to solve a bug while retriving a particular record in database. the code is below plzzz help.

```
Cursor c=Main.db.rawQuery("SELECT * FROM details", null);
```

```
if (c != null ) {  
    c.moveToFirst();  
    do {  
        String firstName = c.getString(0);  
        String pass = c.getString(1);  
  
        if(firstName.equals("harish")){  
            Intent welcome = new Intent();  
            welcome.setClass(Main.this, Welcome.class);  
            startActivity(welcome);  
        }  
  
    }while (c.moveToNext());  
}  
  
};
```

[Reply](#)

**TheCottonSilk** [February 7, 2011 11:39 AM](#)

Hello Sai Geetha,

First, thank you for a simple and all-covered SQLite tutorial!

I would like to take this learning to next level by creating a small app where I can do all this dynamically, except for DB creation - which I want to do it during onCreate().

My requirements: Separate UI

1. To insert records

2. To viewing DB records (simple first 10 records)
3. To delete DB record/s (simple - accept first, last name and age and delete) .

Can you please suggest the approach to go about? I am asking w.r.t. design perspective (and not code!).

[Reply](#)

**Anonymous** [February 8, 2011 3:37 PM](#)

hai geetha your tutorials are very helpful to me .thanks for you.....ARUN,HYD

[Reply](#)

**abg** [February 8, 2011 3:56 PM](#)

hai geetha please explain this meaning:

" where Age > 10 LIMIT 5"

[Reply](#)

**Sai Geetha**  [February 8, 2011 4:02 PM](#)

Hi Abg,

This is a way of paginating the results. If the number of records with AGE > 10 are large in number, this is going to get you only 5 records at a time.

**sathish** November 24, 2011 6:19 PM

Hi Sai Geetha,

Thanks for posting more useful android content for learning.

I have followed the same as you had done in the above blog for SQLite data base creation and querying the data in order.

But i am unable to get the data in order even after using ORDER BY also. can you please let me

know any other things i need to maintain to get the ordered data from the tables.  
It is very helpful for me if you provide some examples on this topic.

Thanks in advance.

Sathish.

hi i want a sqlite query using query() method to retrieve a rows from table using multiple where clause using "?"

for eg:i want to retrieve rows based on the string in 1 of the column name and also according to the

category at the same time

hi geetha :

Im FACING a prob with "like" statement in sqlite.. since couple of days..

My code is `char a[]=String.toCharArray();`

`Cursor c2=db2.query("addingjobsdetails",column,"Jobname"+"like"+"%a[0]",null,null,null,null);`

HERE a[0]..is as per user ..eg: T,G,J..etc.

Could u plz explain this..

Hi Sai... your blogs are amazing...

I am new to Android and have a question... What is a context? And, more importantly, why at all is it required to be passes?

Hello Mam,

I am developing an application in which i have use BroadCastReceiver Class to receive incoming number when someone call to me, now i will get the incoming number through onReceive() method. Now i want to compare the incoming number with records of my database table inwhich i have allready save the phonbook contact.....but i have problem to call database in my BroadCastReceiver class.

In BroadCastReceiver Class when i make object of DBAdapter Class and make cursor to get data one by one it throws nullpointerException.

Please mam help me.....i m waiting for your reply .....

Thank you in andvance.....
