[ROOT][ONE-CLICK] How-To Get ADB running AND Root with SuperOneClick

So I was messing around with different one clicks since I got ADB going on my kindle fire and I was able to Successfully use SuperOneClick 2.2 to root my kindle fire!

Sorry for the mess. Its late, and I wanted to type this up so I could crash...

To get adb going you must already have the sdk on your machine and used it.

goto: %USERPROFILE%\android and edit the adb_usb.ini and add this to the end of the file and save:

Code:

```
0x1949
```

then go into where you have the sdk at and open the google-usb_driver folder and edit android_winusb.inf and add this to the [Google.NTx86] section and [Google.NTamd64] section:

Code:

```
;Kindle Fire
%SingleAdbInterface% = USB_Install, USB\VID_1949&PID_0006
%CompositeAdbInterface% = USB_Install, USB\VID_1949&PID_0006
```

save and close

If you have already plugged your kindle into the usb you may have to open device manager and find "Kindle" under other devices and choose the android_winusb.inf file.

Turn on Installation of apps from unknown sources: tap the top bar>choose more...(+)>device

open a command prompt and run adb kill-server then try adb devices..

you should see a device listed.

go here: [\[APP\]SuperOneClick v2.2 \(now with zergRush and su 3.0\) - xda-developers](#)

download and run SuperOneClick and choose the "root" option. let it go!

Enjoy!

I would love some of the people working on this project to make the apk for the kindle [e-reader app](#) available so we can use it on other Android Devices.

As you may know, the [Kindle app](#) on the Android Market lacks functionality. You cant change the line spacing or the font type. However, the version of the Kindle App on the Fire is different. It has all the options that regular kindles do... and i want that to improve my reading experience on my Android HP Touchpad

Sorry for the newb question here - anyone know if you can get **VPN Widget** installed and working on the **Fire** once you have root?

I really need a pure IPSec/cisco VPN client since our wireless network at work requires you authenticate via VPN to connect to anything useful.

Just taking a shot in the dark.

Do you have to have adb working to root it? Or can I do it without?

Pretty sure you need adb working per guide to use superoneclick. Since the exploits that superoneclick uses require adb access.

If you're not comfortable. Give it a week and they'll be one click custom methods all over the place.

I was wondering if anybody has tried sideloading z4root and seeing if it works. Since this already-existing multi-device root method works, maybe another would as well...

Especially if you dont have the SDK yet.. having a hard time figuring out what I need and where to find the google-usb_driver folder, so far not a whole lot of luck.
That is what I get for being a newb trying to catch up.

Ahh nevermind, found it. Down under all the Android versions in the SDK is Extras, the "Google USB Driver Package" is under that. Install that and you find the inf file.

Still more clicks than I expected when the headline on many sites today is "one click", but then again what was it Mark Twain said about believing what you read?.

This still seems pretty straightforward despite my newbness.

Last edited by vobguy; November 16th, 2011 at 02:02 PM. Reason: Found the USB driver

Can't post links yet, but there is a tutorial (based on the instructions in here) that details a bit better the "prerequisites" for the one click root.
reviewhorizon.com/2011/11/how-to-root-jailbreak-kindle-fire-using-one-click-solution-superoneclick-also-enable-sideload-apps/

Just a bit of info for any one thinking of rooting the Kindle fire. If you plan on streaming videos with Amazon Prime don't root it just yet.
I rooted mine and I wasn't able to stream I called Amazon Support thinking it was a problem with my account and they said the error [message](#) I was getting was do to rooting, of course I played dumb. I unrooted the device and video streaming is working again.

The error message was something like...."Your device is no longer configure correctly for video playback" or something along those lines.

Just a bit of info 😊

playback" or something along those lines.

Just a bit of info 😊

Yeah, it's been mentioned in the [tech blogs](#) and there's already a work-around:
[Rooting Kindle Fire Breaks Amazon Video \(And How To Make It Work\)](#)

Quote:

Thankfully for you there is a workaround: [OTA RootKeeper](#). This app (for rooted users only) acts as a temporary unroot, keeping a backup of su and removing the default that is detected by Amazon Video. You may also need to visit System Settings > Applications > All Applications > Amazon Video > Force Stop.

hello,

I encountered some problem while run adb commands, therefore ROOT end up failure.

the command output seems wrong, the status is "offline"
does anybody know the reason?

C:\Program Files\Android\android-sdk\platform-tools>adb devices

* daemon not running. starting it now on port 5037 *

* daemon started successfully *

List of devices attached

*****00000001 **offline**

adb finds no devices

I've followed this instructions a couple of times... on three different computer... two xp and one windows 7 but adb finds no devices...

any ideas?

```
C:\android\platform-tools>adb devices
* daemon not running. starting it now on port 5037 *
* daemon started successfully *
List of devices attached
```

Thanks

What worked for me was that I manually input the 0x1949 code, if you copy and paste it to the notepad document it registers it as something else. I had the same problem.

any ideas?

```
C:\android\platform-tools>adb devices
* daemon not running. starting it now on port 5037 *
* daemon started successfully *
List of devices attached
```

Thanks

I am having the same issue. Tried the rooting process on two different computers with the same result 😞

If it's not what RawRmon said about the 0X1949 text being pasted in wrong then: Did you guys plug your Fires into the PC before you had ADB installed and updated? May need to point the Fire at the new driver if so. Open the Fire in device manger, update driver, manually select the folder with the inf file you updated.

Oh and iceman99393: As I understand it: Yes, you still need to edit the files so adb recognizes the Fire. That's the whole point of that. Without doing that it has no clue what the hunk of circuits is on the end of the micro-usb cable.

Here's the same process with pictures and more detailed steps:

[How to root / jailbreak Kindle Fire using one click solution – SuperOneClick, also enable sideloading apps | Review Horizon](#)

Note: DO NOT copy/paste the 0x1949 text from that webpage, it seems it pastes the X as a * or something. Just type it out.

any ideas?*

```
C:\android\platform-tools>adb devices
* daemon not running. starting it now on port 5037 *
* daemon started successfully *
List of devices attached
```

Thanks

I was getting this too. I also tried manually typing in the code to the file. However, this did not work. Apparently, the .android folder was installed into the wrong user folder. I suspect this results from me meddling with the user folders a while back. I have several folders that are named JohnSmith and JohnSmith.003 etc.

So I just copied the .android folder into the correct one and ran the commands again.

Root doesnt work

<p>New Member</p> <p>Join Date: Nov 2011 Posts: 1</p> <p>Device(s): Thanks: 0 Thanked 0 Times in 0 Posts</p> 	<p>Hi Guys/Girls, I got the latest over the air update to my kindle fire. It updated, i tried to re-root (using superoneclick) and nothing, it doesnt work. I have 3 questions: 1)Has anyone managed to root it with this update 2)If not is there a way to restore to an earlier point in time (Before update). 3)Is there something that can block over the air updates till I approve them?</p> <p><i>Last edited by Trelane; December 21st, 2011 at 07:56 PM. why?*

There are alot of reasons why it might not have worked. Incorrect or missing drivers, incorrect settings in the device or it is not set up for the Galaxy 7.7. You can look [here](#) for rooting information though.

So I was messing around with different one clicks since I got ADB going on my kindle fire and I was able to Successfully use SuperOneClick 2.2 to root my kindle fire!

LOL! I seem to recall back in my Ally days using SuperOneClick was a big no no according to most people who developed for it. 😊

You need the kindle fire utility. That method is outdated unless you're on a super old version of software
