Android SQLite Database Tutorial

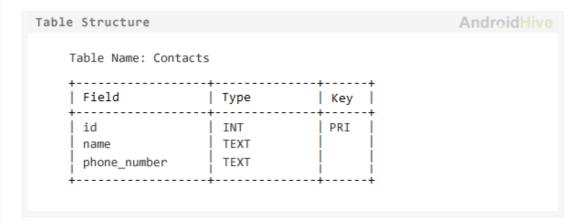

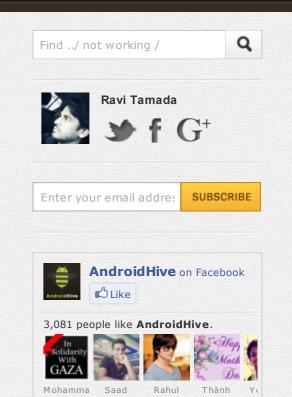

Android provides several ways to store user and app data. SQLite is one way of storing user data. SQLite is a very light weight database which comes with Android OS. In this tutorial I'll be discussing how to write classes to handle all SQLite operations.

In this tutorial I am taking an example of storing user contacts in SQLite database. I am using a table called Contacts to store user contacts. This table contains three columns id (INT), name (TEXT), phone_number(TEXT).

Following is the structure of contacts table.

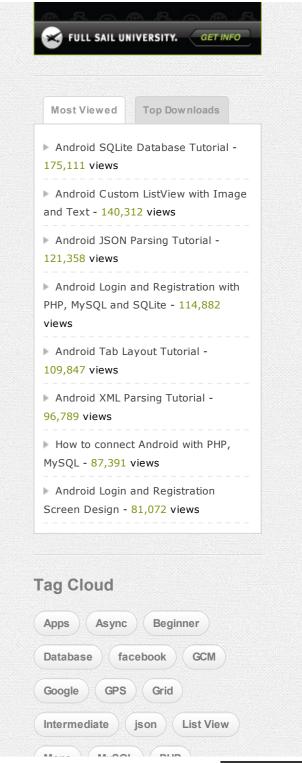

Advertise Here

Writing Contact Class

Before you go further you need to write your Contact class with all getter and setter methods to maintain single contact as an object.

```
Contact.java
package com.androidhive.androidsglite;
public class Contact {
    //private variables
    int id;
    String name;
    String phone number;
    // Empty constructor
    public Contact() {
    // constructor
   public Contact(int id, String name, String phone number) {
        this. id = id;
        this. name = name;
        this. phone number = phone number;
    // constructor
   public Contact(String name, String phone number) {
        this. name = name;
        this. phone number = phone number;
    // getting ID
    public int getID(){
        return this. id;
    // setting id
   public void setID(int id) {
        this. id = id;
    // getting name
    public String getName() {
        return this. name;
    // setting name
   public void setName(String name) {
        this. name = name;
    // getting phone number
    public String getPhoneNumber() {
        return this. phone number;
    // setting phone number
   public void setPhoneNumber(String phone number) {
        this. phone number = phone number;
```

}

Writing SQLite Database Handler Class

We need to write our own class to handle all database CRUD(Create, Read, Update and Delete) operations.

- 1. Create a new project by going to File New Android Project.
- 2. Once the project is created, create a new class in your project src directory and name it as DatabaseHandler.java (Right Click on src/package New Class)
- 3. Now extend your DatabaseHandler.java class from SQLiteOpenHelper.

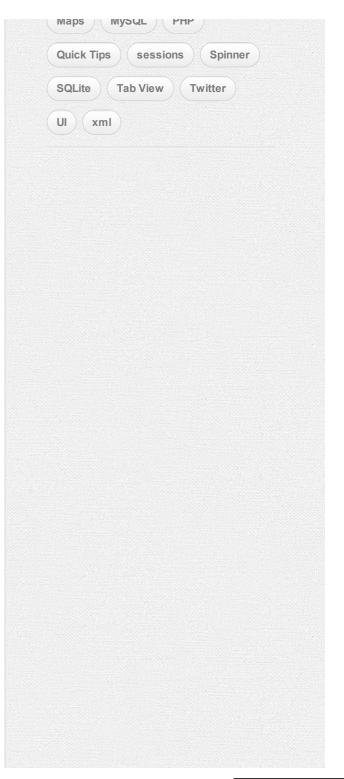

```
public class DatabaseHandler extends SQLiteOpenHelper {
```

4. After extending your class from SQLiteOpenHelper you need to override two methods onCreate() and onUpgrage()

onCreate() - These is where we need to write create table statements. This is called when database is created.

onUpgrade () - This method is called when database is upgraded like modifying the table structure, adding constraints to database etc.,

```
public class DatabaseHandler extends SQLiteOpenHelper {
   // All Static variables
   // Database Version
   private static final int DATABASE VERSION = 1;
   // Database Name
   private static final String DATABASE NAME = "contactsManager";
   // Contacts table name
   private static final String TABLE CONTACTS = "contacts";
   // Contacts Table Columns names
   private static final String KEY ID = "id";
   private static final String KEY NAME = "name";
   private static final String KEY PH NO = "phone number";
   public DatabaseHandler(Context context) {
        super(context, DATABASE NAME, null, DATABASE VERSION);
   // Creating Tables
    @Override
   public void onCreate(SQLiteDatabase db) {
       String CREATE CONTACTS TABLE = "CREATE TABLE " + TABLE CONTACTS + "("
                + KEY ID + " INTEGER PRIMARY KEY, " + KEY NAME + " TEXT,"
                + KEY PH NO + " TEXT" + ")";
       db.execSQL(CREATE CONTACTS TABLE);
```

```
// Upgrading database
@Override
public void onUpgrade(SQLiteDatabase db, int oldVersion, int newVersion) {
    // Drop older table if existed
    db.execSQL("DROP TABLE IF EXISTS " + TABLE_CONTACTS);

    // Create tables again
    onCreate(db);
}
```

All CRUD Operations (Create, Read, Update and Delete)

Now we need to write methods for handling all database read and write operations. Here we are implementing following methods for our contacts table.

```
// Adding new contact
public void addContact (Contact contact) {}

// Getting single contact
public Contact getContact(int id) {}

// Getting All Contacts
public List<Contact> getAllContacts() {}

// Getting contacts Count
public int getContactsCount() {}

// Updating single contact
public int updateContact(Contact contact) {}

// Deleting single contact
public void deleteContact (Contact contact) {}
```

Inserting new Record

The addcontact() method accepts Contact object as parameter. We need to build ContentValues parameters using Contact object. Once we inserted data in database we need to close the database connection.

```
addContact()
    // Adding new contact
public void addContact(Contact contact) {
    SQLiteDatabase db = this.getWritableDatabase();

    ContentValues values = new ContentValues();
    values.put(KEY_NAME, contact.getName()); // Contact Name
    values.put(KEY_PH_NO, contact.getPhoneNumber()); // Contact Phone Number

    // Inserting Row
    db.insert(TABLE_CONTACTS, null, values);
    db.close(); // Closing database connection
}
```

Reading Row(s)

The following method getContact() will read single contact row. It accepts id as parameter and will return the matched row from the database.

```
getContact()
   // Getting single contact
public Contact getContact(int id) {
   SQLiteDatabase db = this.getReadableDatabase();
   Cursor cursor = db.query(TABLE CONTACTS, new String[] { KEY ID,
           KEY NAME, KEY PH NO }, KEY ID + "=?",
           new String[] { String.valueOf(id) }, null, null, null, null);
   if (cursor != null)
       cursor.moveToFirst();
   Contact contact = new Contact(Integer.parseInt(cursor.getString(0)),
           cursor.getString(1), cursor.getString(2));
   // return contact
   return contact;
```

getAllContacts () will return all contacts from database in array list format of Contact class type. You need to write a for loop to go through each contact.

```
getAllContacts()
   // Getting All Contacts
public List<Contact> getAllContacts() {
  List<Contact> contactList = new ArrayList<Contact>();
   // Select All Ouerv
   String selectQuery = "SELECT * FROM " + TABLE CONTACTS;
   SQLiteDatabase db = this.getWritableDatabase();
   Cursor cursor = db.rawQuery(selectQuery, null);
   // looping through all rows and adding to list
   if (cursor.moveToFirst()) {
           Contact contact = new Contact();
           contact.setID(Integer.parseInt(cursor.getString(0)));
           contact.setName(cursor.getString(1));
           contact.setPhoneNumber(cursor.getString(2));
           // Adding contact to list
           contactList.add(contact);
       } while (cursor.moveToNext());
   // return contact list
   return contactList;
```

getContactsCount() will return total number of contacts in SQLite database.

```
getContactsCount()
// Getting contacts Count
   public int getContactsCount() {
       String countQuery = "SELECT * FROM " + TABLE CONTACTS;
       SQLiteDatabase db = this.getReadableDatabase();
       Cursor cursor = db.rawQuery(countQuery, null);
       cursor.close();
       // return count
       return cursor.getCount();
```

Updating Record

updateContact() will update single contact in database. This method accepts Contact class object as parameter.

```
updateContact()
   // Updating single contact
public int updateContact(Contact contact) {
   SQLiteDatabase db = this.getWritableDatabase();
   ContentValues values = new ContentValues();
   values.put(KEY NAME, contact.getName());
   values.put(KEY PH NO, contact.getPhoneNumber());
   // updating row
   return db.update(TABLE CONTACTS, values, KEY ID + " = ?",
           new String[] { String.valueOf(contact.getID()) });
```

Deleting Record

deleteContact() will delete single contact from database.

```
deleteContact()
   // Deleting single contact
public void deleteContact(Contact contact) {
   SQLiteDatabase db = this.getWritableDatabase();
   db.delete(TABLE CONTACTS, KEY ID + " = ?",
            new String[] { String.valueOf(contact.getID()) });
   db.close();
```

Complete DatabaseHandler.java Code:

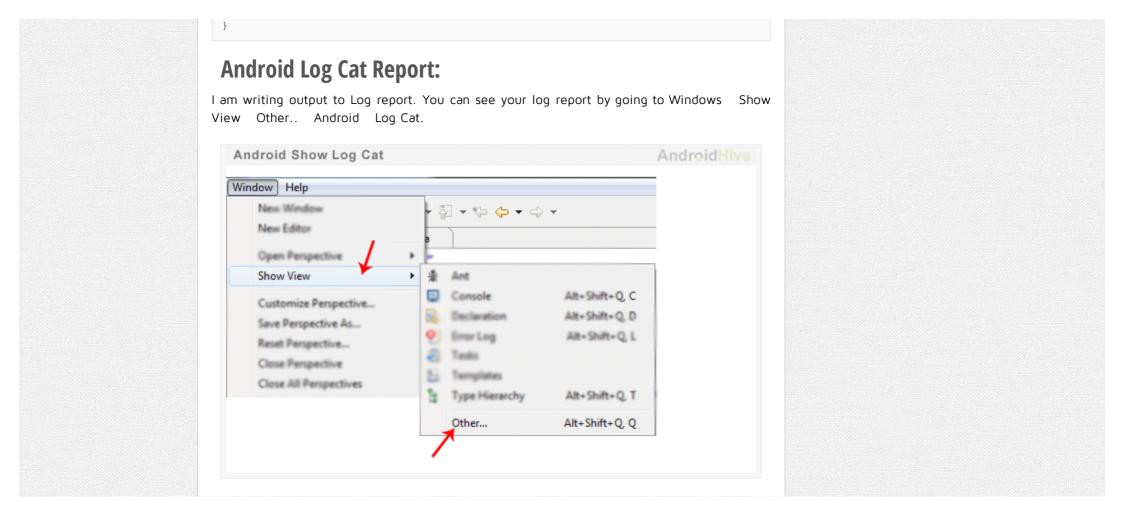

```
DatabaseHandler.java
package com.androidhive.androidsglite;
import java.util.ArrayList;
import java.util.List;
import android.content.ContentValues;
import android.content.Context;
import android.database.Cursor;
import android.database.sqlite.SQLiteDatabase;
import android.database.sqlite.SQLiteOpenHelper;
public class DatabaseHandler extends SQLiteOpenHelper {
   // All Static variables
   // Database Version
   private static final int DATABASE VERSION = 1;
   // Database Name
   private static final String DATABASE NAME = "contactsManager";
   // Contacts table name
   private static final String TABLE CONTACTS = "contacts";
   // Contacts Table Columns names
   private static final String KEY ID = "id";
   private static final String KEY NAME = "name";
   private static final String KEY PH NO = "phone number";
   public DatabaseHandler(Context context) {
       super(context, DATABASE NAME, null, DATABASE VERSION);
   // Creating Tables
   @Override
   public void onCreate(SQLiteDatabase db) {
       String CREATE CONTACTS TABLE = "CREATE TABLE " + TABLE CONTACTS + "("
               + KEY ID + " INTEGER PRIMARY KEY," + KEY NAME + " TEXT,"
                + KEY PH NO + " TEXT" + ")";
       db.execSQL(CREATE CONTACTS TABLE);
   // Upgrading database
   @Override
   public void onUpgrade(SQLiteDatabase db, int oldVersion, int newVersion) {
       // Drop older table if existed
       db.execSQL("DROP TABLE IF EXISTS " + TABLE CONTACTS);
       // Create tables again
       onCreate (db);
    * All CRUD(Create, Read, Update, Delete) Operations
   // Adding new contact
   void addContact(Contact contact) {
       SQLiteDatabase db = this.getWritableDatabase();
       ContentValues values = new ContentValues();
       values.put(KEY NAME, contact.getName()); // Contact Name
```

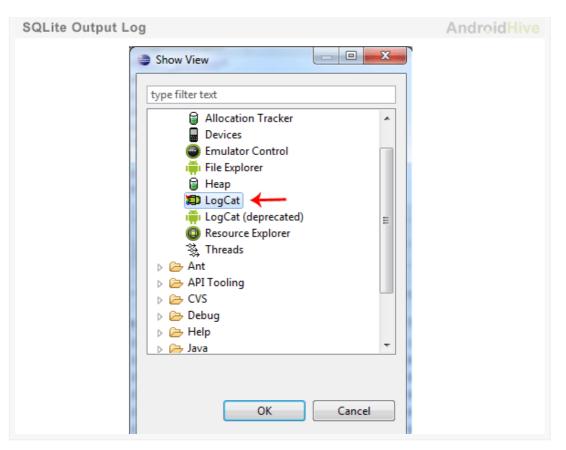

```
values.put(KEY PH NO, contact.getPhoneNumber()); // Contact Phone
    // Inserting Row
    db.insert(TABLE CONTACTS, null, values);
    db.close(); // Closing database connection
// Getting single contact
Contact getContact(int id) {
    SQLiteDatabase db = this.getReadableDatabase();
    Cursor cursor = db.query(TABLE CONTACTS, new String[] { KEY ID,
            KEY NAME, KEY PH NO }, KEY ID + "=?",
            new String[] { String.valueOf(id) }, null, null, null, null);
    if (cursor != null)
        cursor.moveToFirst();
    Contact contact = new Contact(Integer.parseInt(cursor.getString(0)),
            cursor.getString(1), cursor.getString(2));
    // return contact
    return contact;
// Getting All Contacts
public List<Contact> getAllContacts() {
   List<Contact> contactList = new ArrayList<Contact>();
    // Select All Query
   String selectQuery = "SELECT * FROM " + TABLE CONTACTS;
    SQLiteDatabase db = this.getWritableDatabase();
    Cursor cursor = db.rawQuery(selectQuery, null);
    // looping through all rows and adding to list
    if (cursor.moveToFirst()) {
        do {
            Contact contact = new Contact();
            contact.setID(Integer.parseInt(cursor.getString(0)));
            contact.setName(cursor.getString(1));
            contact.setPhoneNumber(cursor.getString(2));
            // Adding contact to list
            contactList.add(contact);
        } while (cursor.moveToNext());
    // return contact list
    return contactList;
// Updating single contact
public int updateContact(Contact contact) {
    SQLiteDatabase db = this.getWritableDatabase();
    ContentValues values = new ContentValues();
    values.put(KEY NAME, contact.getName());
   values.put(KEY PH NO, contact.getPhoneNumber());
    // updating row
    return db.update(TABLE CONTACTS, values, KEY ID + " = ?",
            new String[] { String.valueOf(contact.getID()) });
// Deleting single contact
public void deleteContact(Contact contact) {
```

```
SQLiteDatabase db = this.getWritableDatabase();
    db.delete(TABLE CONTACTS, KEY ID + " = ?",
            new String[] { String.valueOf(contact.getID()) });
    db.close();
// Getting contacts Count
public int getContactsCount() {
   String countQuery = "SELECT * FROM " + TABLE CONTACTS;
   SQLiteDatabase db = this.getReadableDatabase();
   Cursor cursor = db.rawQuery(countQuery, null);
   cursor.close();
    // return count
    return cursor.getCount();
```

Usage:

```
AndroidSQLiteTutorialActivity
package com.androidhive.androidsqlite;
import java.util.List;
import android.app.Activity;
import android.os.Bundle;
import android.util.Log;
import android.widget.TextView;
public class AndroidSQLiteTutorialActivity extends Activity {
   @Override
   public void onCreate(Bundle savedInstanceState) {
        super.onCreate(savedInstanceState);
        setContentView(R.layout.main);
        DatabaseHandler db = new DatabaseHandler(this);
        * CRUD Operations
        // Inserting Contacts
        Log.d("Insert: ", "Inserting ..");
        db.addContact(new Contact("Ravi", "9100000000"));
        db.addContact(new Contact("Srinivas", "9199999999"));
        db.addContact(new Contact("Tommy", "9522222222"));
        db.addContact(new Contact("Karthik", "9533333333"));
        // Reading all contacts
        Log.d("Reading: ", "Reading all contacts..");
        List<Contact> contacts = db.getAllContacts();
        for (Contact cn : contacts) {
            String log = "Id: "+cn.getID()+" , Name: " + cn.getName() + " , Phone: " + c
                // Writing Contacts to log
        Log.d("Name: ", log);
```

Hello

Good example :) like that all the db handling is in one single file.

Some question tho about closing for db and cursor.

1 - For e.g. "addContact" you open a db for writing so you close it in the end [db.close();].

But for "updateContact" you don't, why?

Is the db closed "automatically" when it is "return:ed" [return db.update(...);] or something?

2a - When should the cursor be closed?

Why is it only closed in "getContactsCount" but not in the other methods that reads from the db?

2b - and why could a closed cursor be return:ed [return cursor.getCount();]?

3 - why are the db.update(...); return:ed in "updateContact" but db.insert(...); is not in "addContact"? What do the return do here? Isn't the "result" type the same, just data "added" in both?

Thanks in advance

Thanks for this tutorial, it's helped a lot, but I'd also like to know these answers. Logcat reports

close() was never explicitly called on database ...

android.database.sqlite.DatabaseObjectNotClosedException: Application did not close the cursor or database object that was opened here

Which I believe is related. Thanks.

I forgot to close database connection in one function. Check the code in Sqlite hanlder class. You need to use .close() method.

Vlad Turbuleasa

to close the DB we must get a int variable and store the row affected by the db.update(), am i right? Thanks for the tutorial!

Great examples, they helped a TON, but I was also curious about these same issue.

Why is "get all contacts" writing data, instead of reading? 10 months ago 5 Likes Like Reply **Ravi Tamada** Ya it is wrong . It should be readable. 9 months ago in reply to Guest 3 Likes Like Reply **Eric Itzhak** I think you should change the code and fix the stuff that's wrong, for future copy-pasters. Like Reply 5 months ago in reply to Ravi Tamada 4 Likes Guest I think he shouldn't !:)) 2 months ago in reply to Eric Itzhak Like Reply Karan Great tutorial! Clear cut. Although, has the code been updated with the correct version? 4 months ago in reply to Ravi Tamada 1 Like Like Reply Guest It's because the SQLite DB isn't storing the objects directly, just their information. So when you return the data, you have to reconstruct the objects before you return them. I think... 8 months ago in reply to Guest Like Reply A guest how to do a upgrade??

If you have same name for class local variable and incoming parameters then if you want use the variable of class then you need to use 'this' key word

Hi Ravi,

Could you please make a tutorial on how to make spinner and save the values selected from spinner in database please. I am able to save the values of edit text, date and time picker but dont know how to make spinner in the same class where I have code for time picker and date picker and save the values of spinner in the database. Please reply, I will be very thankful.
